

# New RW models offer easier operation

TWO of Robinson Willey's contract and retail gas fire ranges, the Firecharm LF/RS (*pictured*) and Sahara LF/RS, have been enhanced to include electronic ignition and a larger control handle for ease of operation. In addition, both ranges now feature a disabled control handle as standard.

RW says electronic ignition serves to ensure that all models across the two ranges ignite smoothly and the easily replaced batteries are stored at the bottom of the fire. The top-positioned larger control handle provides a user-friendly device for the elderly and infirm, whilst the specially designed disabled handle meets the needs of the arthritic and disabled.

To enable the fires to blend with both contemporary and traditional interiors, and a wide range of fire surrounds, the Firecharm range has been given a more streamlined and minimalist look.

RW's marketing manager, Tracey Falshaw, comments, "As these fires continue to be a popular choice in the social housing, new build and retail sectors, our commitment to their longevity remains resolute. These latest enhancements are testimony to RW's ongoing commitment to gas fire design, innovation and technology in response to today's energy efficiency and safety requirements."

Comprising 12 models across both LF and RS ranges, the Firecharm and Sahara fires are said to represent some of the most energy efficient models currently available. LF models are 88.1% efficient and have a maximum heat output of 4.4kW and the RS balanced flue models are 88% efficient with a maximum heat output of 3.57kW.

RW fires are available via a nationwide network of nominated retailers and distributors. For further information contact RW's sales office on 0151 530 5150.
